Effect of speech on performance – an evidence-based model promoting noise control in offices

Valtteri Hongisto

Senior research scientist, FIOH @ Turku

Adjunct professor, Aalto University @ Helsinki

+358405851888 valtteri.hongisto@ttl.fi

SAFE Workshop, Dortmund Germany 4-5 November 2015

Bundesanstalt für Arbeitsschutz und Arbeitsmedizin (BAuA)

Background

- According to several independent field surveys, noise is the most adverse factor of IE in open-plan offices.
 - Frontzcas et al 2012 *Indoor Air*
- Speech is the most distracting type of office noise
 - Haapakangas et al. *ICBEN 2008*
- Laboratory experiments have shown that speech impairs the performance of cognitively demanding tasks
 - Colle and Welsh 1976 *J Verbal Learn Verbal Behav*
 - Vast number of successors; see review by Hongisto 2005 *Indoor Air*

- Speech intelligibility determines the distracting power of speech primarily, not the sound pressure level of speech.
 - Colle 1980 *J Verbal Learn Verbal Behav*

- A well-documented objective descriptor of subjective speech intelligibility is STI
 - IEC 60268-16
 - Houtgast&Steeneken 1985 *J Acoust Soc Am*
- **Could we explain the performance effects of speech in such the terms of engineering so that these findings could benefit noise control in open-plan offices?**

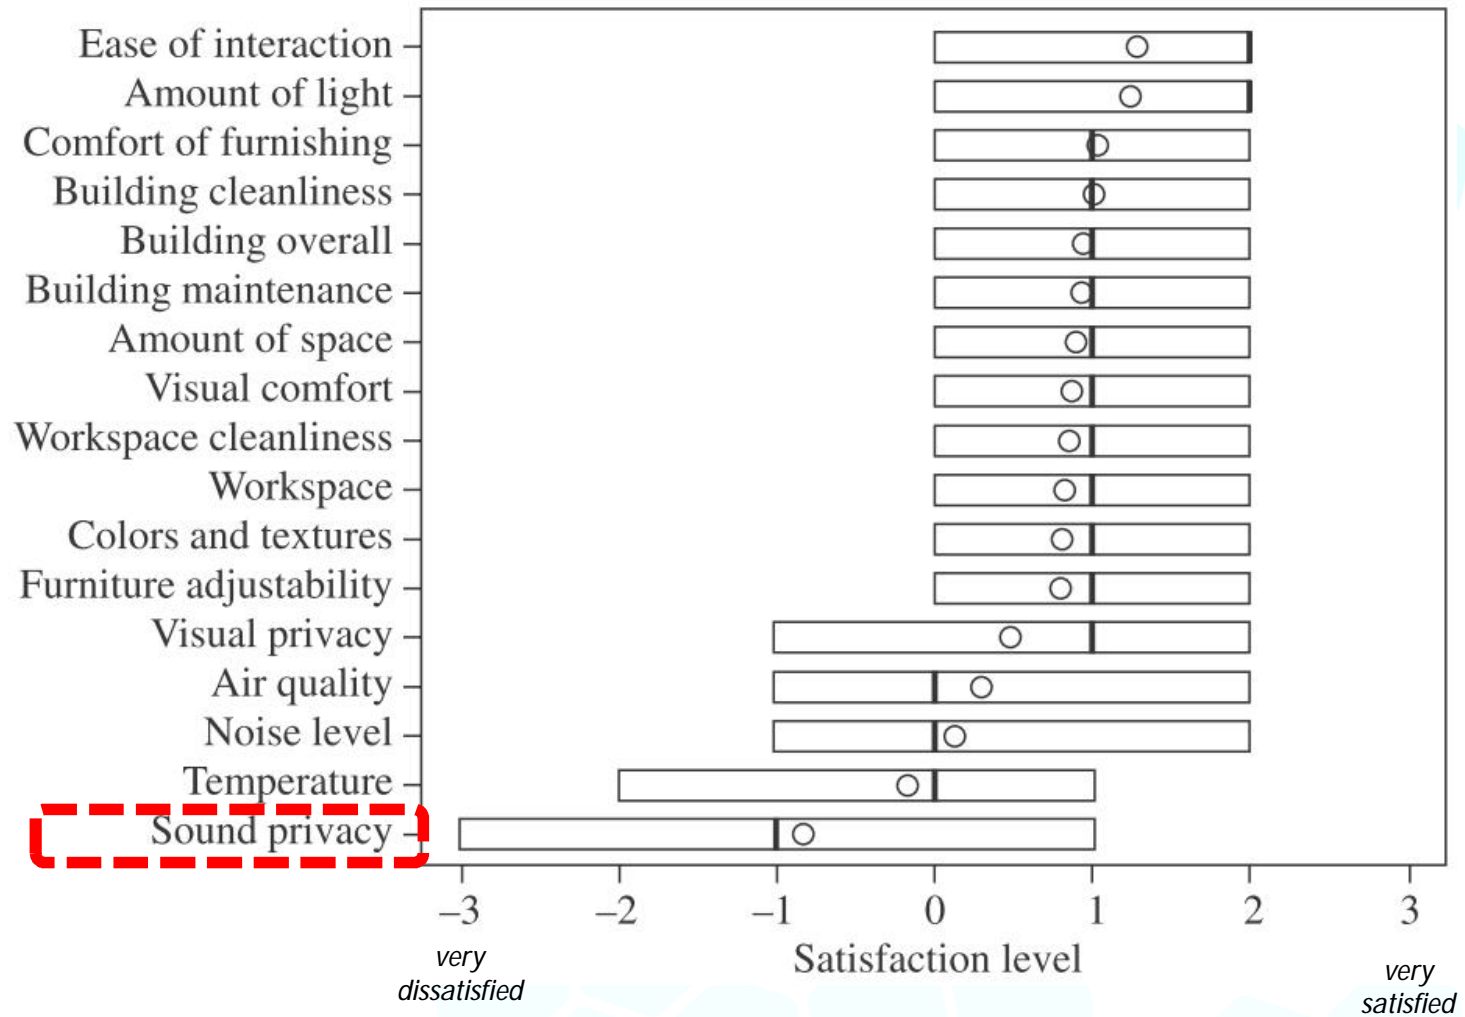

Background

Frontzac et al, *Indoor Air* 2012

52.920 occupants in 351 buildings

U.S. Offices

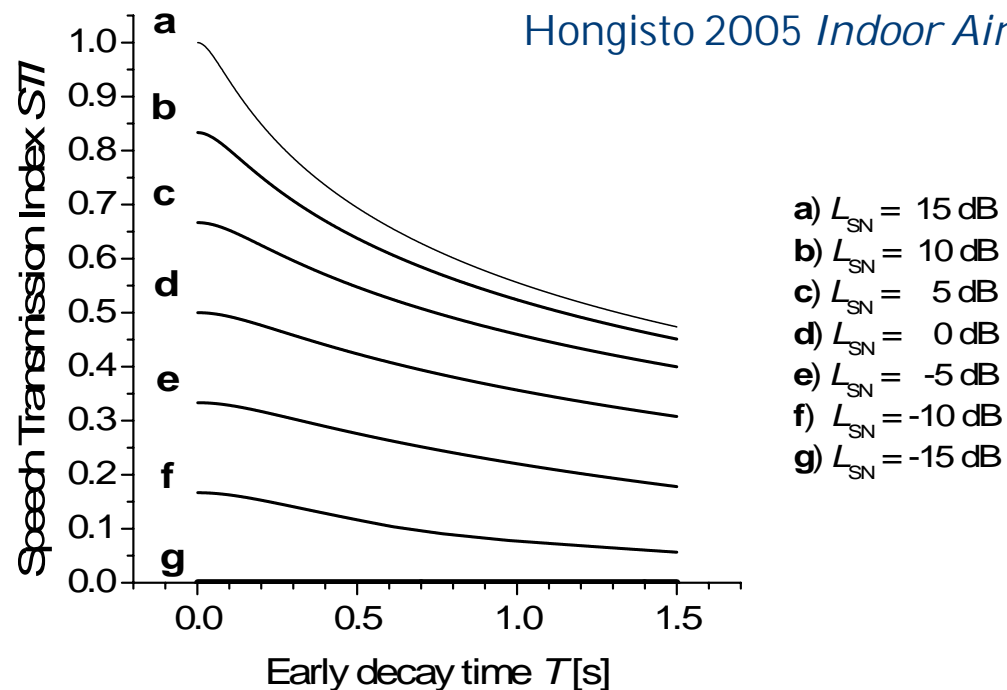

2000-2010

STI

- STI can be reduced by
 - reducing speech-to-noise ratio
 - Increasing background level
 - Reducing speech level
 - increasing reverberation time (EDT)

Hongisto 2005 *Indoor Air*

STI	Speech intelligibility	Speech privacy	Examples in offices
0.00 ... 0.05	very bad	confidential	Between two single-person office rooms, high sound insulation
0.05 ... 0.20	bad	good	Between two single-person office rooms, normal sound insulation
0.20 ... 0.40	poor	reasonable	Between workstations in a high-level open-plan office Between two single-person office rooms, doors open
0.40 ... 0.60	fair	poor	Between desks in a well designed open-plan office
0.60 ... 0.75	good	very poor	Between desks in an open-plan office, reasonable acoustical design
0.75 ... 0.99	excellent	no	Face-to-face discussion, good meeting rooms Between desks in an open-plan office, no acoustical design

Review of experimental work prior to 2004

Hongisto 2005 *Indoor Air*

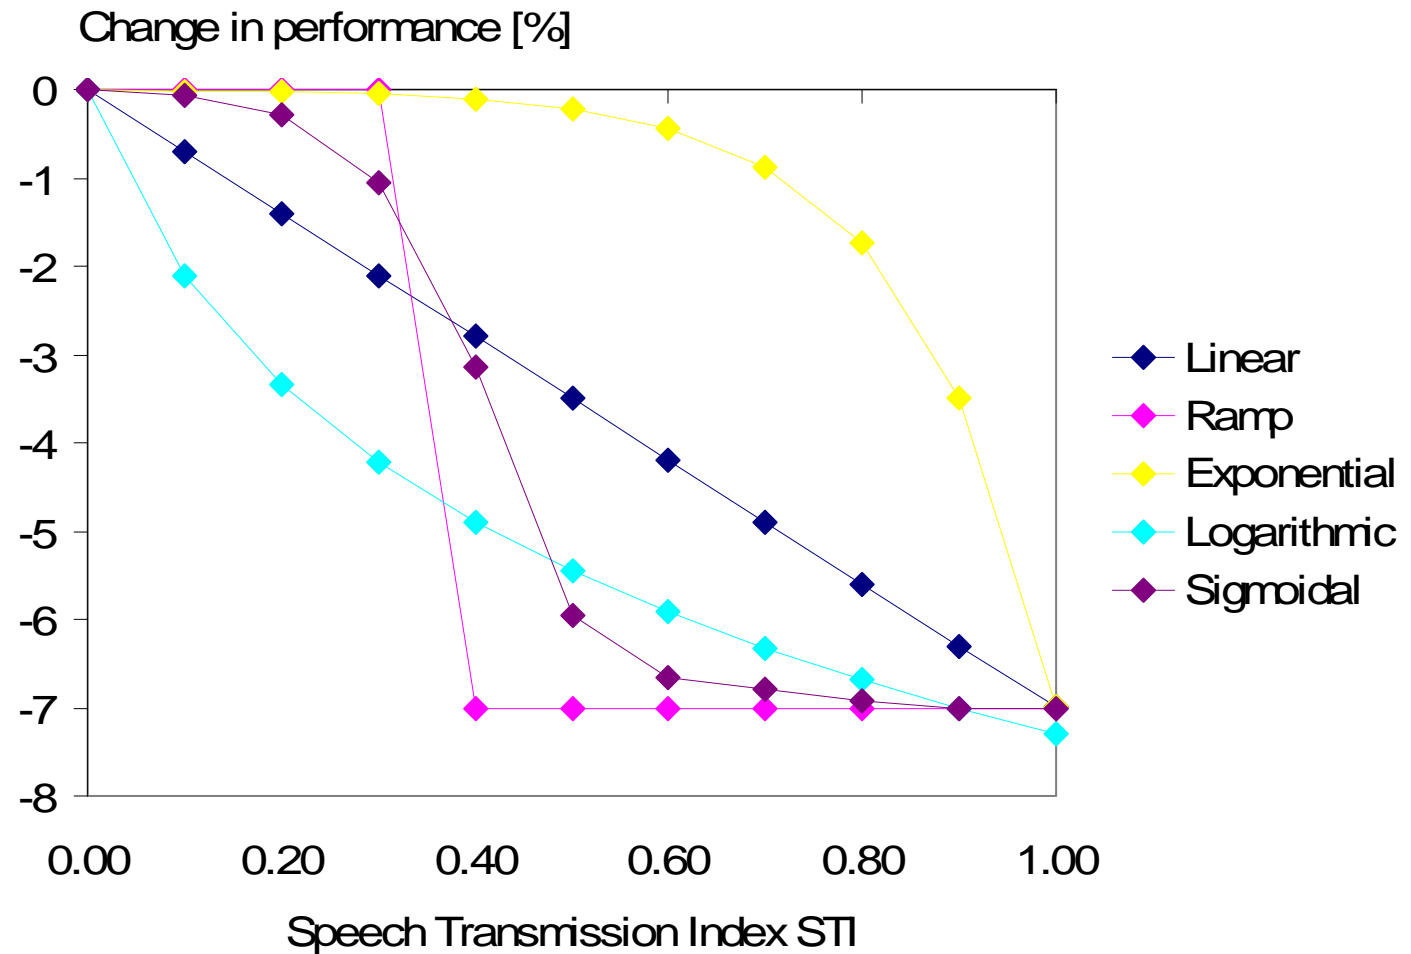

Change in performance DP [%]

Alternatives of functional shapes

Dependence of subj. intelligibility on STI

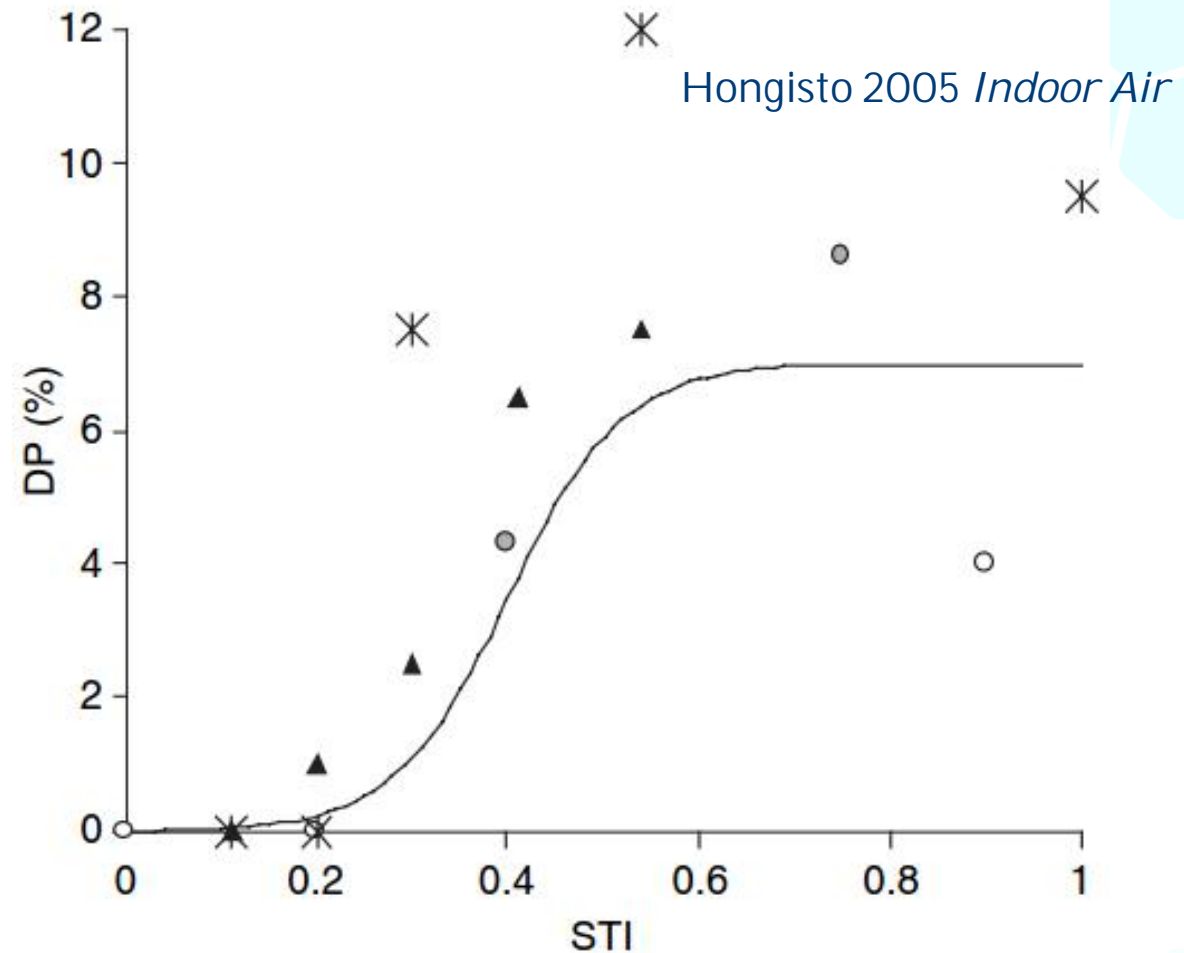

Hongisto 2005 *Indoor Air*

Subjective speech intelligibility [% correctly heard]

Original model

- Hypothetic model
 - Speech intelligibility vs. STI curve is applied for performance loss
 - Various task types are combined
 - Lack of data
- Perfect performance when STI below 0.20
- Max. performance loss is achieved when 0.50

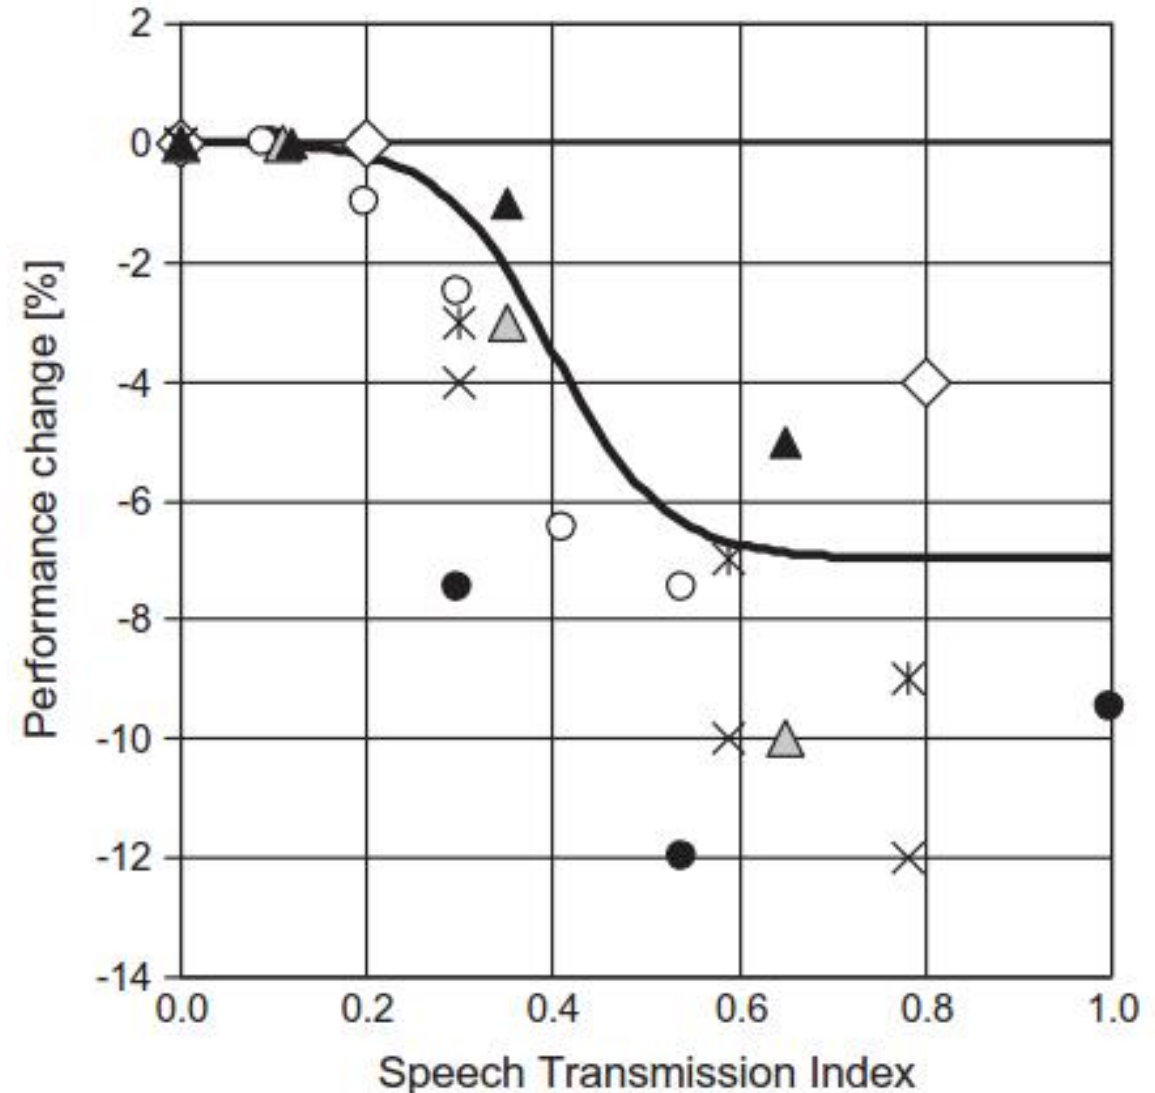

- Prediction model
- Venetjoki et al. (2005)
- Kaarlela et al. (2005)
- ✱ Ellermeier and Hellbrück (1998) Exp. 2A
- ▲ Ellermeier and Hellbrück (1998) Exp. 2B

Recent update

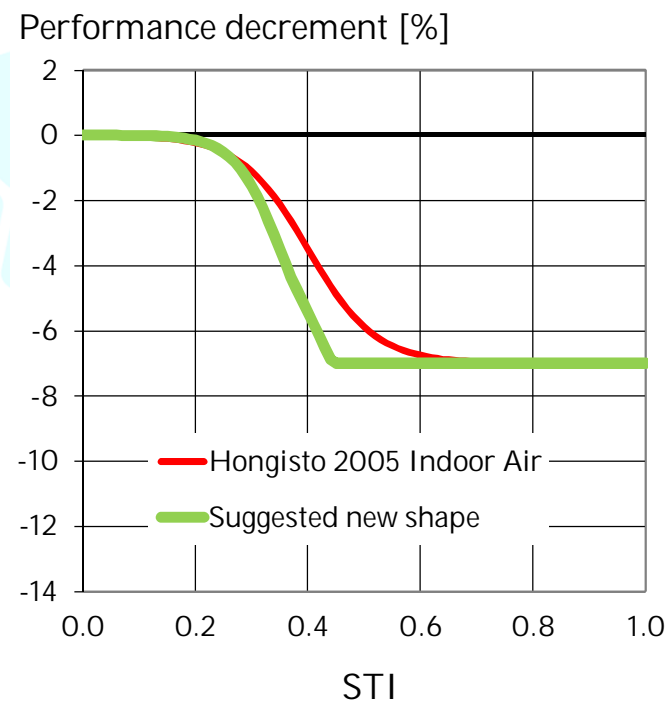

Jahncke, Hongisto, Virjonen 2012 *Appl Acoust*

- Hongisto's model [1]
- Ellermeier and Hellbrück (1998) Exp. 2A [12]
- Ellermeier and Hellbrück (1998) Exp. 2B [12]
- ◇ Venetjoki et al. (2006) [13]
- △ Haka et al. (2009) Task1 [14]
- ▲ Haka et al. (2009) Task2 [14]
- × Schlittmeier et al. (2008) Exp. 1 [15]
- ✱ Schlittmeier et al. (2008) Exp. 2 [15]

Recent experimental work

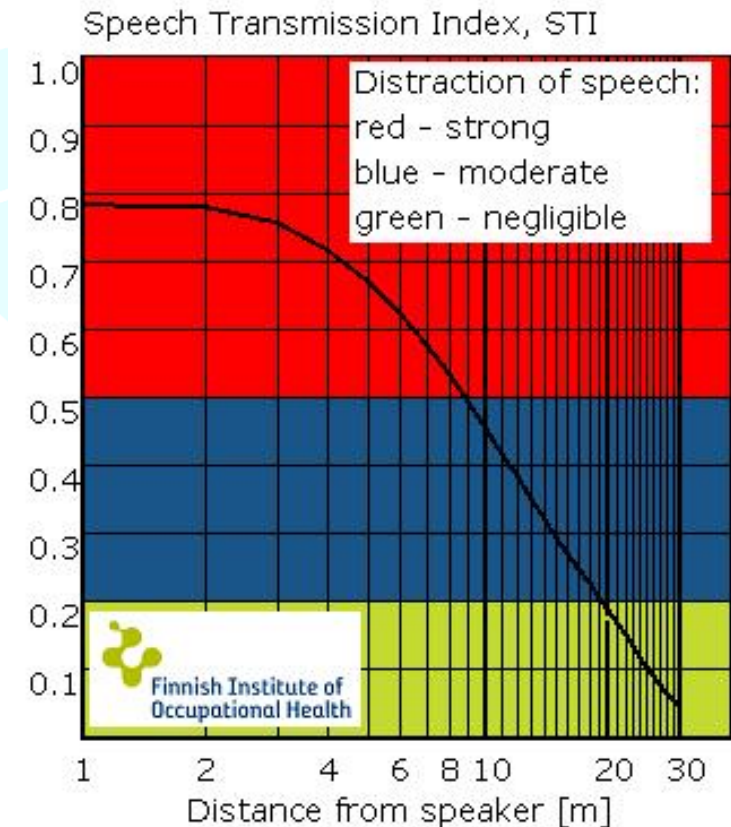

- More or less support has been given to the model
 - Keus van de Poll 2014 *Appl Acoust*
 - Ebissou et al 2015 *Appl Acoust*
 - Jahncke et al. 2012 *Appl Acoust*
 - Schlittmeier and Liebl 2015 *Facilities*
 - Hongisto et al. 2015 (*Published in Finnish*)
- A more general model also exists
 - Schlittmeier et al. 2012 *Atten Percept Psychophys*
 - Working memory performance as a function of fluctuation strength

- True shape may not be sigmoidal but steeper
- The exact form of the model may never be found
 - Type of task, type of speech, other factors
- Nevertheless, the detriments of irrelevant speech can be controlled by reducing STI

Application

- STI was could be proven to be such an important objective quantity that it should be measured in open-plan offices
- STI was chosen to [ISO 3382-3:2012](#)
 - Acoustics – Measurement of room acoustic parameters. Part 3. Open-plan offices
- STI of normal effort speech is measured as a function of distance, as well as the SPL of speech
- Distraction distance r_D is the distance where STI falls below 0.50.

RESULTS

DL2: 9.3 dBA
rD: 8.0 m

A-weighted speech level

Speech Transmission Index

Global promotion of noise control

- 2007: ICA preliminary method
 - 2008: First national guidelines for rD and D_{2S} in Finland
 - 2012: ISO 3382-3 in 2012
 - 2010: Numbers of cross-sectional studies have emphasized the noise problem in open-plan offices
-
- Research in the area is still growing – Health aspects have received larger interest
 - Business possibilities of acoustic consultancy has increased
 - Room acoustic models and measurement apparatus have improved w.r.t. new compact features needed in open-plans
 - Material manufacturers disseminate the r&d evidence to improve their business
